Experiment No. 7

Aim:

Case Study on Hyperledger

Theory:

Private Blockchain

	Non - Permissioned	Permissioned
Public	Bitcoin	Ripple Hyperledger Fabric
Private	Multichain in a small lab, without permissions	
	PRIVATE BLOCKCHA	IIN
ORGANIZATION TYPE	Single entity or organization	
Users	Known & trusted participants	
Access	Access fully restricted	
NETWORK TYPE	Centralized; single point of failure	
OPERATION	Pre-approved participants can read &/or initiate transactions	
VERIFICATION	Single validator node or central authority to create a block	
IMMUTABILITY	Secured by distributed consensus	
CONSENSUS MECHANISM	Voting or variations of PoW/PoS consensus algorithms	
SECURITY	Security is dependent on the blockchain architecture adopted.	
TRUST	Entrusted; central control	
TRANSACTION SPEED	High; secs to create a block	
ENERGY CONSUMPTION	Low	
SCALABILITY	Better scalability as high storage and computational power is not required	

Private blockchains are used by individual hobbyists or by private enterprises or organizations with a specific purpose (e.g., an NGO may like to keep a record of money spentin various schools). Organizations prefer using a private blockchain, if they would like to control:

- who can use the system
- who can write to the system
- who can read the system

Besides, organizations need a solution with a mechanism to ensure users are added via process, and user rightsarecreated, changed, or deleted by an authorized user. These needs arose and gave birth to a need for private blockchain. In addition, the solution needs faster transactions, proper audit trail, interactions with the organization's existing IT systems.

Hyperledger:

The Linux Foundation took up the challenge for an open-source enterprise-grade distributedledger technology and announced the Hyperledger Project in December 2015.

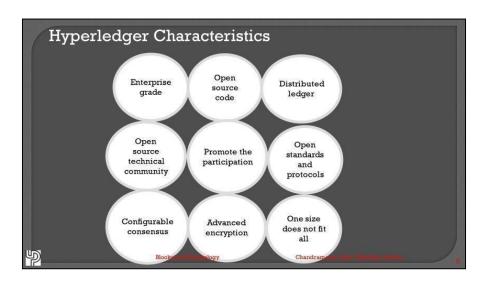

The approach was to ensure that the best practices of computer science related to distributed computing are used in blockchain for enterprise solutions.

It needs to be noted that Hyperledger has stated they will not be issuing itscryptocurrency

Mision of hyperledger:

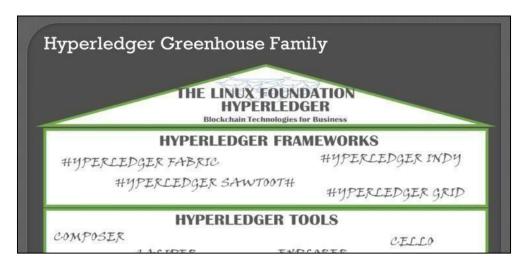

As per hyperledger.org, the mission of Hyperledger Project (HLP) is to

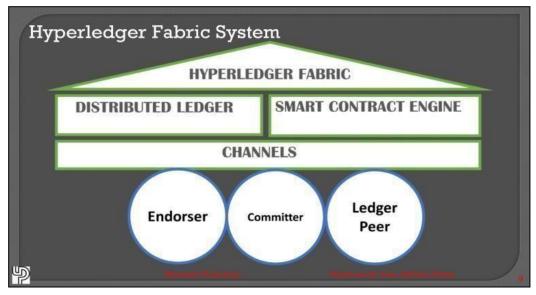

- create an enterprise-grade, open-source distributed ledger framework and codebase
- create an open-source, technical community to benefit the ecosystem of the HLP(Hyper LedgerProject) solution
- promote the participation of leading members of the ecosystem, including developers, service and solution providers and end-users.

Department of Computer Science & Engineering (Data Science)

Hyperledger Indy:

Hyperledger INDY, a part of the hyperledger framework, is a blockchain tool for digital identity. An organization called sovrin.org donated the code base for INDY.

INDY is known for providing digital identities in a decentralized environment. INDY provides tools, libraries, and reusable components for the creation of digital identities. INDY's status is incubation, although it has documented specifications for identity along with sample implementation are available.

As Hyperledger, INDY is related to identity, and being a blockchain, an identity created once cannot be altered. Designers and administrators of INDY are requested to have propertraining for foundational concepts, which includes the following:

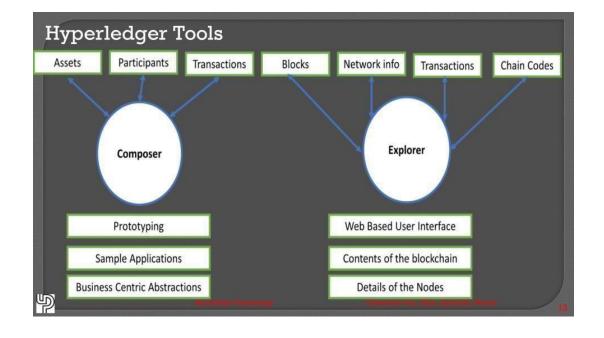

- Privacy by design
- Privacy-preserving technologies

Hyperledger Sawtooth:

Sawtooth is a distributed ledger technology and powered with a smart contract engine. The sawtooth project started with a contribution via Intel. Sawtooth offers a robust runtimeenvironment, even allowing change of consensus approach in run time. Sawtooth being a permissioned layer bring restrictions via Access Control Lists, nodes are put into these restrictions: Who can connect to the network? Who can send consensus messages? Who can submit transactions to the network? Sawtooth is the only project within Hyperledger Project: that uses Ethereum: and smart contracts are written via solidity, as it is written in Ethereum. Even the smart contracts can be deployed on the fly to the sawtooth network.

Hyperledger Grid:

Hyperledger Grid is a framework (a framework is a set of best practices to achieve a task). Grid is focussed on only one segment: Supply chain Management. Being a framework, Hyperledger grid does not contain rules; instead it is an ecosystem detailing a blockchain for supply chain management. It includes data sets, frameworks that work together, letting application developers choose the best-suited technology or methodology as per company's requirement.

TT ... I .l. ... / ... I...

Hyperledger tools:

Composer:

Composer offers business-centric abstractions as well as sample apps, which are used to test or replicate businessproblems. Composer is handy when you have to build an application part of Proof-of-Concepts (PoC), and you have a concise timeline. Composer operates as a rapid prototyping tool for user-facing solutions. Hyperledger fabric is the underlying mechanism to operate a blockchain for the composer. Composer allows for creation/modification of the following:

- Assets
- Participants
- Transactions

Explorer: is another tool hosted in the Hyperledger greenhouse, which provides aweb-based user interface.

Hyperledger Explorer allows the user to view contents in the blockchain, and list the nodesHyperledger Explorercan view, invoke, deploy or query. These nodes include the following:

- Blocks
- Transactions
- Network information (name, status, list of nodes)
- Chain codes.

Hyperledger Fabric: is the most popular of the Hyperledger project. All blockchains strive to solve the problem of trust and time, and blockchain Hyperledger fabric is no different. Hyperledger fabric is amongst the best solutions where the organization can choose the trust mechanism it needs to use. The issue of trust has a profound impact on Supply Chain Management, which is the most, talked and piloted use-case of blockchain.

Before you install Hyperledger Fabric, you must first download and install the prerequisites that are required torun a Docker-based Fabric test network on your local machine from https://hyperledger-fabric.readthedocs.io/en/latest/prereqs.html.

Hyperleder Fabric Prerequisites Setup:

Curl Installation

Run below command to install Curl.

\$ sudo apt-get install curl

Verify the installation and check the version of Curl using below command.

\$ curl-version

NodeJs Installation

Open the terminal window and run below command to download and execute the nodejs file.

\$ curl-sL https://deb.nodesource.com/setup_10.x | sudo-E bash-

Then run below command.

\$ sudo apt-get update

Run below command to start the installation for NodeJs.

\$ sudo apt-get install nodejs

Run below command to check if Nodejs is successfully installed or not. This should return the version of NodeJs.

\$ node –version

Git Installation

Open the terminal window and run below command. This will start the installation for Git.

\$ sudo apt-get install git

Run below command to check if Git is successfully installed or not. This should return the version of Git.

\$ git-version

Python Installation

In the terminal window, run below command to install Python.

\$ sudo apt-get install python

Verify the installation by running below command and that should return the version of Python.

\$ python-version

Lib Tools Installation

Install Lib tools using below command.

\$ sudo apt-get install libltdl-dev

Install Docker CE (Community Edition)

First download and then install it using below commands.

- \$ wget https://download.docker.com/linux/ubuntu/dists/xenial/pool/stable/amd64/<u>docker-ce_18.06.3~ce~3-0~ubuntu_amd64.deb</u>
- \$ sudo dpkg -i docker-ce_18.06.3~ce~3-0~ubuntu_amd64.deb

Check the version of docker using below command and this should return the version of docker.

\$ docker-version

Install Docker Compose

Run below commands to setup Docker compose.

- \$ sudo apt-get install python-pip
- \$ pip --version
- \$ sudo pip install docker-compose

Verify the installation and check the version from below command.

\$ docker-compose version

Department of Computer Science & Engineering (Data Science)

Hyperledger Installation:

Step 1: Run below command to download and setup Fabric.

\$ curl -sSL https://bit.ly/2ysbOFE | bash -s

```
Q = - - x
  radongas@radongas:~/rishi-HyperLedger$ curl -sSL http://bit.ly/2ysb0FE | bash -s

```

Department of Computer Science & Engineering (Data Science)

When you start the network, you will also not get any channel by default. You can check the channel by usingbelow command.

\$ sudo docker exec peer0.org1.example.com peer channel list

This command shows you that, you don't have any channel created.

Step 4: Create new channel by using below command.

\$ sudo ./network.sh createChannel -c testchannel

This will create a new channel with the name test channel.

To verify this channel creation, run below command on both the peers.

- \$ sudo docker exec peer0.org1.example.com peer channellist
- \$ sudo docker exec peer0.org2.example.com peer channellist

```
radongas@radongas:-/rishi-Hyperledger/fabric-samples/test-network

radongas@radongas:-/rishi-Hyperledger/fabric-samples/test-network$ sudo docker exec peer0.org1.example.com peer channel list 2022-10-08 08:58:59.702 UTC 0001 INFO [channelCmd] InitCmdFactory -> Endorser and orderer connections initialized (Channels peers has joined: radongas@radongas:-/rishi-Hyperledger/fabric-samples/test-network$ sudo docker exec peer0.org2.example.com peer channel list 2022-10-08 08:59:08.769 UTC 0001 INFO [channelCmd] InitCmdFactory -> Endorser and orderer connections initialized (Channels peers has joined: radongas@radongas:-/rishi-Hyperledger/fabric-samples/test-network$
```

Step 5: To stop the network, you need to run below command. \$ sudo./network.sh down

Working with State DataBase (Couch DB):

Step 1: Go to fabric-samples folder by using below command.

\$ cd fabric-samples

Step 2: Go to test-network folder by using below command.

\$ cd test-network

Department of Computer Science & Engineering (Data Science)

Step 3: Run below command to start the network and create couchDB containers as well.

\$ sudo ./network.sh up -s couchdb

```
radongas@radongas:~/rishi-Hyperledger/fabric-samples/test-network$ sudo ./network.sh createChannel -c testchannel1

                                                                                                                              couchdb0
radongas@radongas:~/rishi-Hyperledger/fabric-samples/test-network$
```

Step 4: Create new channel by using below command.

\$ sudo ./network.sh createChannel -c testchannel1

This will create a new channel with the name testchannel1.

```
radongas@radongas:~/rishi-Hyperledger/fabric-samples/test-network

+ configtxlator proto_decode --input config_update.pb --type common.ConfigUpdate --output config_update.json
+ jq .

+ cat config_update_json
+ echo '{"payload":{"header":{"channel_header":{"channel_id":"testchannell", "type":2}},"data":{"config_update":{' '"channel_id":'
    '"testchannell', '"isolated_data": T{}, '"read_set": '{ '"groups": '{ '"Application": '{ '"groups": '{ '"org2MSP": '{
    '"groups": '{}, '"mod_policy": '"", '"policies": '{ '"mod_policy": '"", '"policy": null, '"version": '"", '"policy": '", '"mod_policy": '"", '"values": '{\ '"mod_policy": '"", '"values": '{\ '"yroups": '\ '"yroups": '\ '"yroups": '", '"policy": null, '"version": '"", '"policy": '"", '"policy": null, '"version": '"", '"policy": '"", '"po
```

Step 5: To stop the network, you need to run below command.

\$ sudo ./network.sh down

Department of Computer Science & Engineering (Data Science)

Set up the Blockchain Network:

If you've already run through Using the Fabric test network tutorial and have a network up and running, this tutorial will bring down your running network before bringing up a new one.

\$ cd fabric-samples/test-network

Navigate to the test-network subdirectory within your local clone of the fabric-samples repository.

If you already have a test network running, bring it down to ensure the environment is clean.

\$./network.sh down

```
+
                        radongas@radongas: ~/rishi-Hyperledger/fabric-samples/test-network
                                                                               0 = 1
                                                                                       _ n x
radongas@radongas:~/rishi-Hyperledger$ cd fabric-samples/test-network
radongas@radongas:~/rishi-Hyperledger/fabric-samples/test-network$ ./network.sh down

```

Launch the Fabric test network using the network.sh shell script.

Department of Computer Science & Engineering (Data Science)

\$./network.sh up createChannel -c mychannel -ca

This command will deploy the Fabric test network with two peers, an ordering service, and three certificate authorities (Orderer, Org1, Org2). Instead of using the cryptogen tool, we bring up the test network using Certificate Authorities, hence the -ca flag. Additionally, the org admin user registration is bootstrapped when the Certificate Authority is started. In a later step, we will show how the sample application completes the admin enrollment.

\$./network.sh deployCC -ccn basic -ccp ../asset-transfer-basic/chaincode-javascript/-ccl javascript

```
radongas@radongas:~/rishi-Hyperledger/fabric-samples/test-network$ ./network.sh deployCC -ccn basic -ccp ../asset-transfer-basic/chain code-javascript/ -ccl javascript Using docker and docker-compose deploying chaincode on channel 'mychannel' executing with the following - CHANNEL NAME: mychannel - CC NAME: basic - CC SRC_PATH: ../asset-transfer-basic/chaincode-javascript/ - CC SRC_PATH: ../asset-transfer-basic/chaincode-javascript/ - CC SRC_LANGUAGE: javascript - CC SEQ_DESION: 1.0 - CC SEQ_DESION: 1.0 - CC CSEQ_DESION: 1.0 - CC COLL_CONFIG: NA - CC_COLL_CONFIG: NA - CC_COLL_CONFIG: NA - CC_COLL_CONFIG: NA - CC_COLL_CONFIG: NA - CC_INIT_FCN: NA - DELAY: 3 - MAX_RETRY: 5 - VERBOSE: false - peer lifecycle chaincode package basic.tar.gz --path ../asset-transfer-basic/chaincode-javascript/ --lang node --label basic_1.0 + res=0 + peer lifecycle chaincode calculatepackageid basic.tar.gz - PAKKAGE_ID=basic_1.0:5e683b01b74f2190bd47dd362292adda50ef65bf565e4cbf8dddbf50b0b19351 Chaincode is packaged Installing chaincode on peer0.orgl... Using organization 1
```

Behind the scenes, this script uses the chaincode lifecycle to package, install, query installed chaincode, approvechaincode for both Org1 and Org2, and finally commit the chaincode.

Department of Computer Science & Engineering (Data Science)

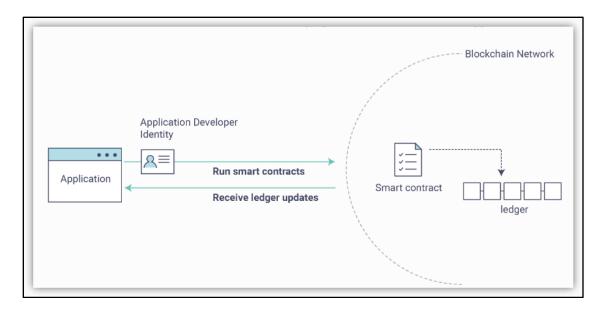

If the chaincode is successfully deployed, the end of the output in your terminal should look like

below:

```
radongas@radongas: ~/rishi-Hyperledger/fabric-samples/test-network
                                                                                                                                                                                                                                            Q | =

 radongas@radongas:~/rishi-Hyperledger/fabric-samples/test-network$ |
```

Next, let's prepare the sample Asset Transfer Javascript application that will be used to interact with the deployed chaincode.

JavaScript Application:

Open a new terminal, and navigate to the application-javascript folder.

Department of Computer Science & Engineering (Data Science)

\$ cd asset-transfer-basic/application-javascript

This directory contains sample programs that were developed using the Fabric SDK for Node.js. Run thefollowing command to install the application dependencies. It may take up to a minute to complete:

Once npm install completes, everything is in place to run the application. Let's take a look at the sample JavaScript application files we will be using in this tutorial. Run the following command to list the files in this directory:

\$ 1s

You should see the following:

```
radongas@radongas:-/rishi-Hyperledger/fabric-samples/test-network$ cd ..
radongas@radongas:-/rishi-Hyperledger/fabric-samples/test-network$ cd ..
radongas@radongas:-/rishi-Hyperledger/fabric-samples$ cd asset-transfer-basic/application-javascript
radongas@radongas:-/rishi-Hyperledger/fabric-samples/asset-transfer-basic/application-javascript$ npm install

DD WARN deprecated querystring@0.2.0: The querystring API is considered Legacy. new code should use the URLSearchParams API instead.

added 193 packages, and audited 194 packages in 38s

26 packages are looking for funding
run 'npm fund' for details

found 0 vulnerabilities
radongas@radongas:-/rishi-Hyperledger/fabric-samples/asset-transfer-basic/application-javascript$ ls
app.js node_modules package.json package-lock.json
radongas@radongas:-/rishi-Hyperledger/fabric-samples/asset-transfer-basic/application-javascript$
```

Let's run the application and then step through each of the interactions with the smart contract functions.

From the asset-transfer-basic/application-javascript directory, run the following command:

- \$ node app.js
 - the application enrolls the admin user.
 - the application registers and enrolls an application user.
 - the sample application prepares a connection to the channel and smart contract.
 - the application initializes the ledger with some sample data.
 - the application invokes each of the chaincode functions.

Using network.sh script.

Conclusion:

Q. Can you provide a real-world case study of how a company implemented Hyperledger technology in its business operations, and what benefits were realized?
